

Conditional Statements

If Statement

If statement is used to execute a block of code only when a specified condition evaluates to True.

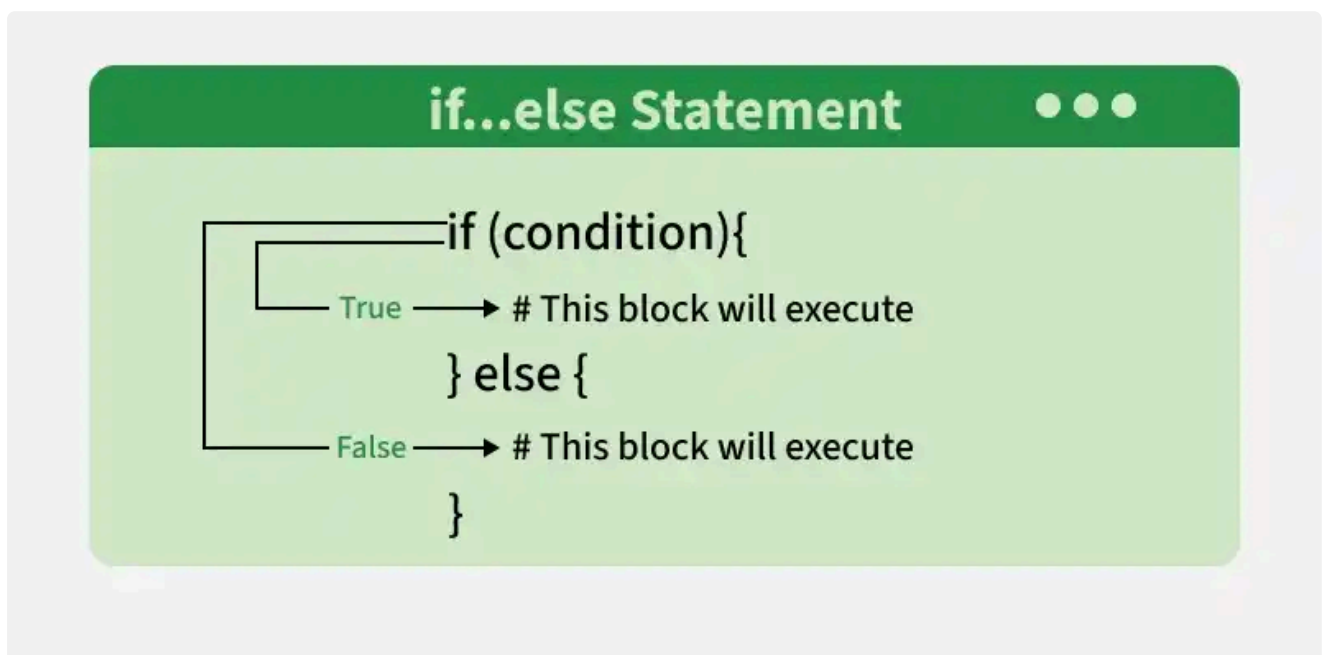

Short Hand if

Short-hand if is used to write if statements in a single line. It is useful when only one statement needs to be executed.

```
1 age = 19
2 if age > 18: print("Eligible to Vote.")
```

If else Statement

[If Else](#) statement is used to execute one block of code when the condition is True and another block when the condition is False.

If-elif-else Statement

elif statement is used to check multiple conditions in a program. It executes a block of code when its condition evaluates to True after previous conditions evaluate to False.

Nested if-else Statement

[Nested if-else](#) statement is an if-else statement placed inside another if or else block. It is used to check conditions within another condition.

Conditional Expression (Ternary Operator)

Conditional Expression ([Ternary Operator](#)) is a short way to write an if-else statement in a single line. It is used when choosing between two values based on a condition.

```
1 age = 20
2 s = "Adult" if age >= 18 else "Minor"
3 print(s)
```

Explanation: If `age >= 18` is True, status is assigned "Adult". Otherwise, status is assigned "Minor".

Match-Case Statement

[Match-Case statement](#) is used to compare a value against multiple patterns and execute the matching block of code. It is similar to the switch-case statement available in other programming languages.

number = 2

```
1 match number:
2     case 1:
3         print("One")
4     case 2 | 3:
5         print("Two or Three")
6     case _:
7         print("Other number")
```
